Sequence 1, Application US/08393305

Patent No. S574138

GENERAL INFORMATION:
APPLICANT: Grabstein, Kenneth
APPLICANT: Elsemman, June
APPLICANT: Elsemman, June
APPLICANT: Rauch, Charles
TITLE OF INVENTION: EPITHELIUM-DERIVED T-CELL FACTOR
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Seed and Berry
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
SOFTWARE: PatentIn Release #1.0, version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/031,399
FILING DATE: 19930308
CLASSIFICATION: 530
ATTORNEY/AGENT INFORMATION:
NAME: Lanner. Charlene
REGISTRATION NUMBER: 2811
TELEPHONE: 206-587-0430
INFORMATION FOR SEQ ID NO: 4:
SEQUENCE CHARACTERISTICS:
LENGTH: 489 base pairs
TYPE: NUCLEIC ACID

A simian species of IL-15 (sIL-15) was purified and analysed by SDS-
RAGE. Bloassay of unstained gel slices indicated IL-15 activity was
assoc. with proteins having mol. wis in the range of 15-17 kba. The
assoc. with proteins having mol. wis in the range of 15-17 kba. The
Identity of the first 33 AAs of AAR83309. Subsequent sequencing of a
constant clone obtd. from a simian library provided a sequence encoding
the polypeptide AAR83436. AAR83436 comprises a relatively short 48 AA
leader sequence and a mature polypeptide AAR83309. The sequence of the
Neterminal 31 AAs of AAR83309 was used to design synthetic PCR primers
of the Neterminus were used to design on primer.
The AA sequences of the simian mature Neterminus 26-31 were used
to design a second primer, a degenerate mixture coding for a
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
colls were used as templates. A 92 bp DNA fragment was used as a
hybridisn. probe to screen a portion of a plasmid library contg.
CONA inserts prepd, from CV-1/EBNA polyadenylated RNA. This
resulted in the isolation of clone C85:sIL-15 that has an ORF
the precursor polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This is the nucleotide sequence encoding a simian epithelium-derived T-cell factor (EFF). The protein was purified from African green monkey CV-1 kidney cells in culture by conventional chromatography: hydrophobic, anion exchange and reverse phase HPLC, followed by separation by SDS-PAGE. The proteins from the SDS-PAGE were transferred to a PVDF membrane and the band corresp. to EFF was cut out for peptide sequencing Primers were synthesised based on this sequence and used to amplify a proliferate by phorbol 12-myristate 13-acetate. The 92 bp fragment was labelled and used as a probe to isolate a clone C85.sFTF which contained this sequence. FTF is a protein of 15-17 kD which is expressed by epithelial cells and stimulates proliferation and/or differentiation of precursor and/or mature T cells. The protein is therefore useful for promoting long term in vivo culture of T-lymphocytes and T-cell lines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     New epithelium derived T cell factor - induces proliferation of T and B cells, stimulates destruction of tumour and virus-infected cells and protects against toxicity, partic. for treating intestinal
                                                                                                                                                                      Human ETF (epithelium derived T cell factor) cDNA was isolated by screening a IMTLH cell cDNA library with a simian ETF probe. The IMTLH cell line was derived from a stable transformation of a human bone marrow stromal cell culture with pSV3Neo. Mature hETF induces proliferation and/or differentiation of precursor or mature T cells and is useful for promoting long-term in vitro culture of T-lymphocytes and T-cell lines. It is used for treating gastrointestinal diseases including peptic ulcer, colltis and malignancy and for treating HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 AIGAGAATTICGAAACCACATITGAGAAGTATTICCATCCAGIGCTACCTGTTTACTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A cDNA clone (AAT36634) codes for simian interleukin-15 (IL-15) (AAR98526), a T-cell growth factor. Muteins of simian IL-15 or human IL-15 (see also AAR98527) are useful as antagonists of IL-15 and can be prepd. by PCFmediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Asp56 and/or Gln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host

                                                                                                                                                                                                  This sequence encodes a human epithelium-derived T-cell factor (ETF) which is used in a method for treating or preventing gastrointestinal disease. These polypeptides have particular application in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy- and radiation-therapy induced enteritis (gut toxicity), mucositis, peptic ulcer disease, gastroenteritis and collis, villus atrophic disorders, malignancy and inflammatory bowel disease. ETF polypeptides may also be useful in the treatment of human immunodeficiency virus (HTV) and HIV-associated disease due to their ability to stimulate CD4+ and CD8+ cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.

The invention relates to an isolated antibody that binds specifically to a similan or human epithelium-derived T-call factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunossaps. They may also be used as diagnostic and therapeutic agents, e.g. when conjugated to toxins (or their precursors) or radionuclides. ETF induces prolliferation and/or differentiation of T cells (or their precursors), e.g. for use in cestablishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. enteritis or mucositis induced by chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, chuman immune deficiency virus infection or associated disease, or generally in any studation requiring stimulation of T or B cell concreased anti-infections of immunoglobulins or certain cytokines, increased anti-infectious disease immunity, induction of T or B cell increased anti-infectious disease immunity, induction of T or E cell lytic cativity or increased destruction of tumour or virus infected cells. The

The IL-15 nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-15. An antagonist of IL-15 can be used for treating an inflammatory bowel disease (IBD). The invention relates to the treatment of celiac disease using IL-15 antagonists. The antagonists are preferably muterins of IL-15, antibodies against IL-15 or IL-15 molecules bound to chemical groups that interfere with the ability of IL-15 to effect a signal transduction through either the alpha or the gamma subunit of the IL-15 receptor complex. The IL-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treating an inflammatory bowel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    <u>;</u>
                                                                                                                                                                                                                                                                                                                      This sequence represents human epithelium-derived T-cell factor (ETF) cDNA. ETF is a previously unidentified T-cell growth factor which stimulates precursor or mature CD4 and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes proliferation of the gastrointestinal epithelium. The protein can be used to promote long-term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it could be used to augment the destruction of tumour cells or virally-linested cells. ETF may also be used to treat or prevent gastrointestinal diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                           disease, including chemotherapy and radiotherapy associated enteritis, assurementaris, colitis, inflammatory bowel disease and villus atrophic disorders. Chemotherapy and radiotherapy associated enteritis (gut toxicity) results in bleeding and sepais due to gastrointestinal flora entering the blood, and thus can limit the dosage of therapeutic agent administered to a cancer patient. ETF may therefore be used to increase the tolerated doses radiotherapy and chemotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CTAAAGAGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and

inflammatory bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The antibodies are further used to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of IV-lymphocytes, to augment anti-infectious disease immunity, to induce CTL. LAK or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a cDNA encoding the human ETF (HETF) polypeptide.

PAGE. Bioassay of unstained gel slices indicated IL-15 activity was associated in the range of 15-17 kba. The association of the 15-17 kba was sequenced. The results indicated the dentity of the first 33 AAs of AAR83309. Subsequent sequencing of a clone obtd. from a simian library provided a sequence encoding the polypeptide AAR83309. Subsequent sequence of the identity of the ARR83309. Subsequence encoding the polypeptide AAR83309. Subsequence of the clone obtd. from a simian library provided a sequence encoding the polypeptide AAR83309. Subsequence of the ideader sequence and a mature polypeptide AAR83309. The sequence of the N-terminal 31 AAs of AAR83309 was used to design synthetic PCR primers for the amplification of IL-15-specific DNA sequences. The first degenerate mixture coding for all possible codon usages. AAT00528.

The AA sequences of the simian mature N-terminus 26-31 were used degenerate mixture coding for a complement of all possible codon usages of AAS 26-31, omitting posn. 3 of Val (AAT00529, AAT00530). Polyadenylated RNAs from CV-1/EBNA polyadenylated RNAs from CV-1/EBNA polyadenylated RNA. This resulted in the isolation of clone C855.SIL-15 that has an ORRF for the in AARMANAS AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gatacagtagaaaatcttatcatcctagcaaacaacatcttgtcttctaatgggaatata 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            205 ATTGATGCTACTTTATATACAGAAAGTGATGTTCACCCCAGTTGCAAGGTAACAGCAATG 264

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to similar and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel diseases, for increasing tolerated diseases. For radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The conditions where it is desired to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B lymphocytes, to augment anti-infectious disease immunity, to induce CTL, LMK or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a cDNA encoding the human ETF (hETF) mature polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antibodies that specifically binds epithelium-derived T-cell factor polypeptide useful for e.g. treating or preventing gastrointestinal diseases, HIV and HIV-associated diseases, augmenting destruction of tumour cells

                                                                                                                                                                                                                                       ó
sequence and cDNA sequence analysed (see AAR83309, AAR83436, AAR00524, AAT00525). Both the simian and the human ORFs encode a precursor polypeptide (AAR83436, AAR83438). The precursor polypeptides a 48-AA leader sequence and a sequence encoding mature simian or human IL-15 polypeptides. The active sinian and human IL-15 polypeptides are disclosed in AAR83309 6, AAR8310 respectively. The invention also comprises other mammalian IL-15, including human IL-15, that hybridise to probes defined by AAR8438. A plasmid contg. a recombinant clone of human IL-15 CDNA was abeposited with ATCC on Feb. 19 1993 under ATCC 69245. The deposit was named 141-hETF. AAR83435 is a mammalian mature IL-15 polypeptide. It is a generic sequence which encompasses both AAR83309 (simian) and AAR83310 (human) IL-15 mature polypeptides.

      New epithelium derived T cell factor - induces proliferation of T and B cells, stimulates destruction of tumour and virus-infected cells and protects against toxicity, partic. for treating intestinal disease and HIV infection
                                                                                The simian ETF (epithelium derived T cell factor) was isolated from African green monkey CV1/EBNA cell conditioned medium. The N-terminal sequence of the purified sETF was determined and then PCR primers were designed based on the sequence information. A 92 bp fragment was amplified from CV1/EBNA DNA and was used as a probe to screen a CV1/EBNA EDNA ilbrary for the full-length sETF coding proliferation and/or differentiation of precursor or mature T cells and is useful for promoting long-term in vitro culture of T-1ymphocytes and T-cell lines. It is used for treating gastrointestinal diseases including peptic ulcer, colitis and
                                                                                                                                                                                                                                                                                  0

This is the nucleotide sequence encoding a human epithellum-derived the corresp. African green was obtained using a 1.37 kb fragment of the corresp. African green monkey gene (AAT42242) as a probe to screen a cDNA library constructed from RNA derived from the IMTLH cell line. This cell line is derived by stable transformation of a human bone marrow stromal cell culture with psylace. From a pool of about 1000 cDNA clones, one clone I41.hETF contained this sequence. ETF is a protein of 15-17 kb which is expressed by epithelial cells and stimulates proliferation and/or differentiation of precursor and/or mature T cells. The protein is therefore useful for promoting long term in vivo culture of T-lymphocytes and T-cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     67 ACTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGTGCAGGG 126

                                                                                                                   A cDNA clone (AAT36635) codes for human interleukin-15 (IL-15) (AAR98527), a T-cell growth factor. Muteins of human IL-15 or simian IL-15 (see also AAR98526) are useful as antagonists of IL-15 and can be prepd. by PCR-mediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Asp56 and/or Gln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Interleukin-15; IL-15; mutant; human; treatment; autoimmune disease; psoriasis; multiple sclerosis; rheumatic arthritis; immune response; type 1 diabetes; AIDS; ss.
Antagonists of interleukin-15 - are used to treat patients having symptoms of graft-versus-host disease and for prolonging allo:graft survival
                                                                                                                                                                                                                                                                                                                                                                                                    ö

This DNA encodes a wild-type interleukin-15 (IL-15) polypeptide. This wild-type sequence can be mutated at codon positions 149 and 156 to create a mutant IL-15 polypeptide. The mutant polypeptide is at least of the callular vents that normally occurs when wild-type IL-15 and is capable of inhibiting at least one of the callular events that normally occurs when wild-type IL-15 specifically binds to a cell surface receptor. The mutant IL-15 is used for suppressing the immune response in a patient. It can be used for treating autoimmune diseases such as rheumatic arthritis, type I diabetes or a rheumatic disease selected from systemic lupus erythematosus (SLE), Siograen's syndrome, scleroderma, mixed connective tissue disease.

It can also be used to treat Hashimoto's thyroiditis, Grave's disease, dermatomyositis, polymyositis, seiter's syndrome and Behcet's disease, contiple sclerosis, myasthenia gravis, encephalomyelitis, a variety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular injury. The mutant IL-15 can also be used for reducing the viability of a cell that expresses a IL-15 antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                      This DNA encodes a mutant interleukin-15 (IL-15) polypeptide. The wild-type IL-15 sequence was mutated at codon positions 149 and 156 to create this mutant IL-15 polypeptide is at least ore diether this mutant IL-15 polypeptide is at least one of the cellular events that normally occurs when wild-type IL-15 one of the cellular events that normally occurs when wild-type IL-15 one of the cellular events that normally occurs when wild-type IL-15 or a restrict in a patient. It can be used for treating autoimmune diseases such as rheumatic arthritis, type I diabetes or a rheumatic disease selected from systemic lupus erythematosus (SIE), Sjogram's syndrome, solerodarma, mixed connective tissue disease.

It can also be used to treat Hashimoto's thyroiditis, Grave's disease, multiple sclerosis, myasthenia gravis, encephalomyelitis, a variety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular injury. The mutant IL-15 can also be used for reducing the viability of a cell that expresses a IL-15 receptor. It can also be used to diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Compans. contgo. IL-15 to stimulate muscle growth, differentiation or hypertrophy are claimed. The stimulation of muscle growth is useful for treating atrophy, or wasting, in particular, skeletal and cardiac muscle atrophy. The compans. further comprises a steroid, growth hormone and insulin-like growth factor. Congestive heart failure, muscle wasting and diabetes-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CTCCCTAAAACAGAAGCCAACTGGGTGAATGTAATAAGTGATTTGAAAAAATTGAAGAT 186

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence encodes human interleukin-15 (IL-15), which can be used in immunogenic amount of a vaccine antigen (Ag) and an immunogenic amount of a vaccine antigen (Ag) and an immunogenicity-augmenting amount of IL-15. The composition is useful for enhancing the immunogenicity of a vaccine. The cytokine IL-15 is a potent enhancing the immunogenicity of a vaccine. The cytokine IL-15 is a potent of these cells and augments T cell mediated immune responses. The vaccine composition can sufficiently elicit an immune response without being deflectants to the recipient, especially when using pathogenically deficient antigens. Some vaccines do not elicit a strong immune response and cannot provide sufficient protection on further exposure to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; interleukin-15; IL-15; T cell; B cell; proliferation; vaccine;

These polypeptides have particular application in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy and radiation-therapy induced enteritis (gut toxicity), mucositis, peptic ulcer disease, gastroenteritis and colitis, villus atrophic disorders, malignancy and inflammatory bowel disease. ETF polypeptides may also be useful in the treatment of human immunodeficiency virus (HIV) and HIV associated disease due to their ability to stimulate CD4+ and CD8+ cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.
                                                                                             Epithelium derived T-cell factor; ETF; simian; gastrointestinal disease; B-cell stimulation; epithelium; villi; CD4+; CD8+; T-cell stimulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGTGCAGGG 126

The invention relates to an isolated antibody that binds specifically to a simian or human epithelium-derived T-cell factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunoassays. They may also be used as diagnostic and therapeutic agents. e.g. when conjugated to toxins (or their precursors) or radionuclides. ETF induces proliferation and/or differentiation of T cells (or their precursors), e.g. for use in establishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. enteritis or mucositis induced by chemotherapy or radiation, peptide ulcer, gastroenteritis, collitis, villus atrophy, malignancy and inflammatory bowel disease), to treat human immune deficiency virus infection or associated disease, or generally in any situation requiring stimulation of T or B cell corressed anti-infected destruction of tumour or virus-infected cells. The received the constant of the constant o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence. The IL-IS nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-IS. An antagonist of IL-IS can be used for treating an inflammatory bowel disease (IBD). The invention relates to the treatment of cellac disease using IL-IS antagonists. The antagonists are preferably muteins of IL-IS, antibodies against IL-IS or IL-IS molecules bound to chemical groups that interfere with the ability of IL-IS to effect a signal transduction through either the alpha or the gamma subunit of the IL-IS receptor complex. The IL-IS antagonists of the invention can be used to treat irritable bow disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of antagonists of interleukin-15 for treating an inflammatory bowel disease, particularly celiac disease

ETF is a previously unidentified T-cell growth factor which stimulates precursor or mature CD4+ and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes proliferation of the gastrointestinal epithelium. The protein can be used to promote long-term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it could be used to augment the destruction of tumour cells or virallyinfected cells. ETF may also be used to treat or prevent gastrointestinal disease, including chemotherapy and radiotherapy associated enteritis,
                                                                                                                                                                                                      CD4+;
